

Blog Four – Assessment Three

Internet Design Principles

Image and Media Plugins

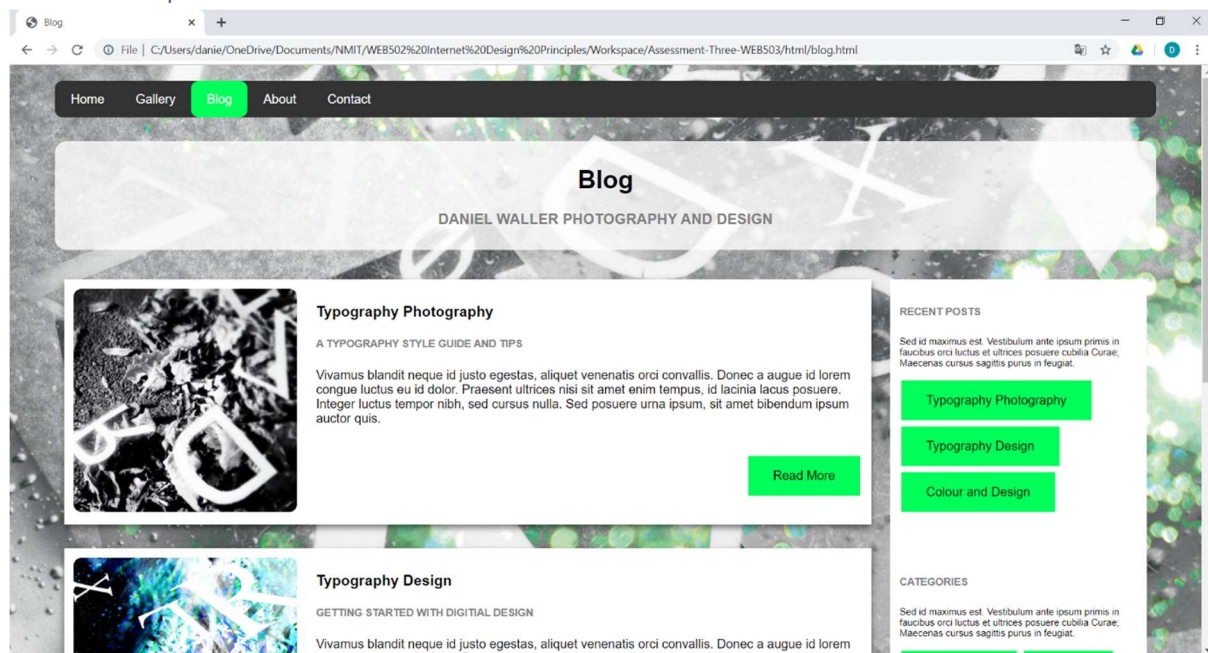

I have designed a responsive media gallery to showcase the work I have completed for easy view on the gallery page. The page consists of thumbnail images for placed inside a div container designed in flexbox. Images are interactive with hover properties and a lightbox with JavaScript – see below.

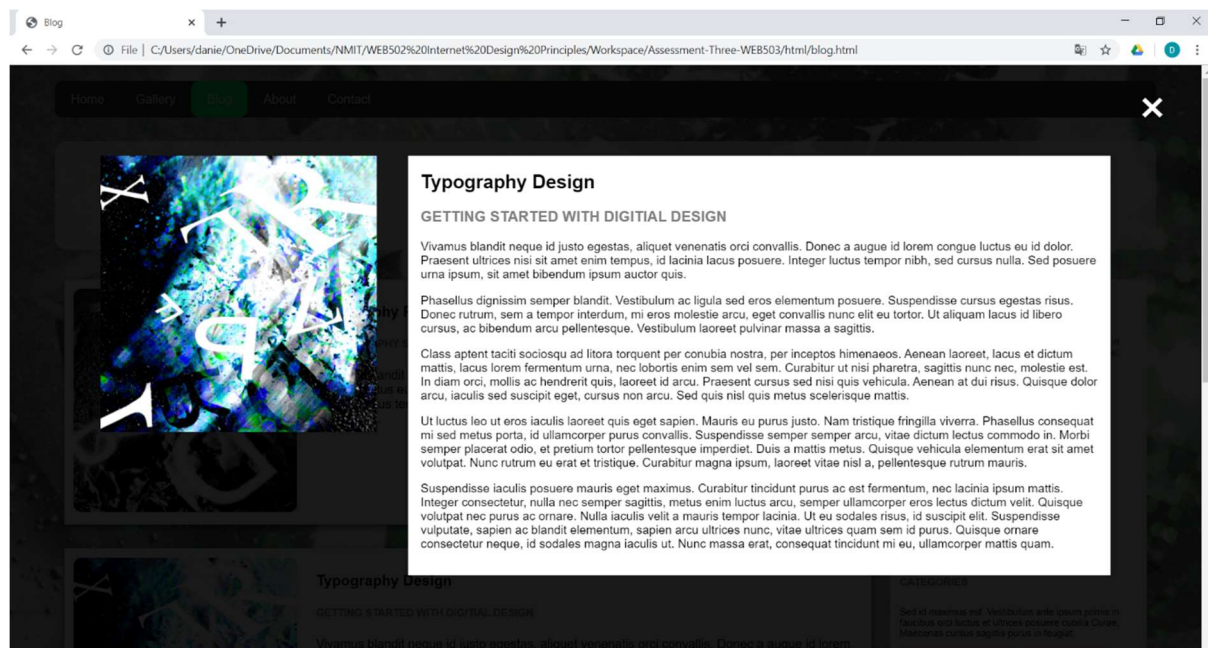

I have implemented a lightbox using JavaScript here to view the full-sized images and simple usability here with a thumbnail view to browse all images on a simple one-page view format.

Content Implementation

Simple content implementation has been used with the use of H1 through to H4 headings and simple paragraphs designed to give users a quick view of the information available to them. Users can see more detailed information by clicking the blog or topic they want to see more of – see below.

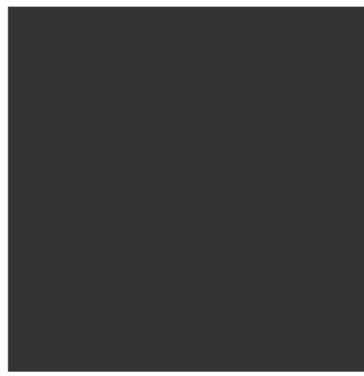

Full-sized easy to read articles with simple layout for the user to read and understand. Simple sans serif font layout makes text easier on the eye. Full-page articles are an overlay with some JavaScript to implement.

Colour Implementation

I used one of my typography images as a standard background for all my pages. I used this as my inspiration for a simplistic colour choice. Going for a simple grayscale theme with a pop of colour, less than 10% coverage per page for interest and contrast.

Green (#00ff59) used for active page navigation, buttons and icons – less than 10%-page coverage designed to complement other green tones in the background page image.

Black (#333) used in navigation, footer and icons to blend with the grayscale colours in the background image.

White (#ffffff) used in content boxes for contrast and readability of text. Grey used for subheadings to give style to content.
